Sheet: 1

Task: Planning Visualisation

① Global Fertility Rate Trend 2023

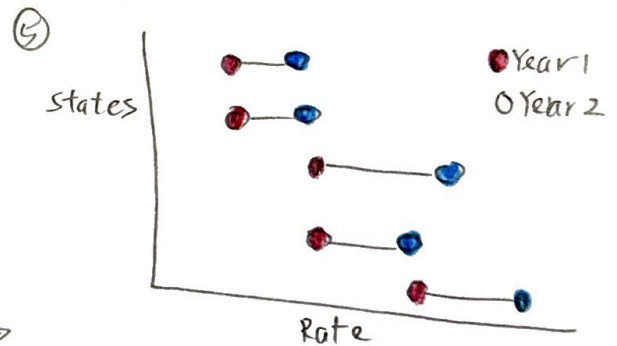

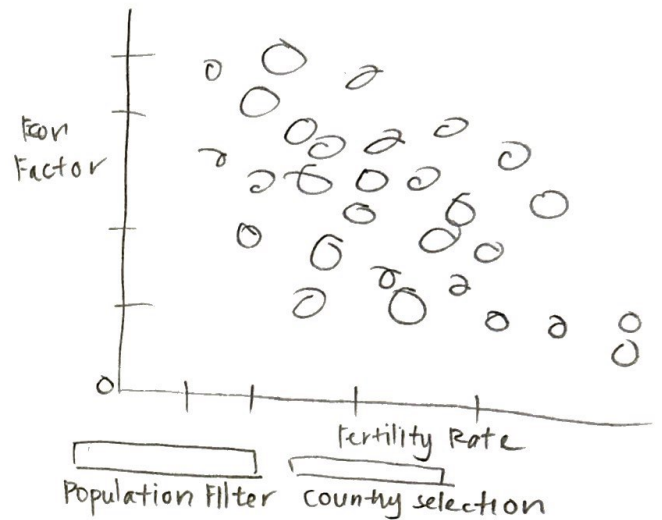

② Fertility Rate For several Countries

④ vary by Age in Malaysia

③ Relationship of Fertility Rate with any economic factors

Filter

Categories

showing Trends Around World Across Countries

Showing Relationship Between Fertility Rate & Economic Factor

Interesting Facts

Datasets and show Trends of Fertility Rate in Malaysia

Combine and Refine

① and ② are related but 2 is static and clearer to show the trend of rate across years. But ① is better to visualize certain years combining both is the solution.

Questions

- Does my visualisation present a clear and interesting story
- Does it have a appropriate level of interactive exploration
- Is there any chart too complicated to understand?

LAYOUT

Sheet: 2

Task: Design Global Trend and Select Interaction

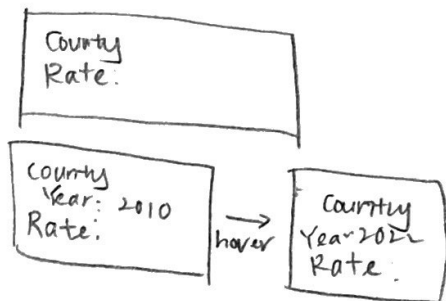

OPERATION

① Add Text Annotation to mark important data points

② Year slider
Map Changes along with year

③ Tooltip
- see the details of the hovered country

FOCUS

- ①
-
- Normalised value
 - we use sequential colour scheme to represent the quantitative value
 - select proper amount of threshold
- year slider
- important interactive elements

- ②
-
- use 8 different colours to represent different categorical attributes
 - choose the most worth visualising countries
 - from different continent
 - different history, political issues, and family planning

DISCUSSION

Advantages:

- clear visual storytelling
- consistent layout
- use of color
- descriptive titles, immediately let users know what each section discusses
- annotations making data more accessible and easier to understand

Disadvantages:

- potential overlapping
- may overwhelm user with too many graphs shown at once

LAYOUT

minimum population

continent selection

Sheet 3

Task: Design Factors that might Affect Fertility Rate & Interesting Questions

OPERATION

- minimum population

determine the range of data to visualise
slide right and filter
- Continent selection

select from 7 continents
to see particular data of Continent selected

FOCUS

- different size of bubble ~~and~~ represents different population amount
 - select different colour for categorical attributes
 - make sure high saturation to visualise
- same colour for every country
 - sort ~~for~~ descendingly so that we can see highest easily

DISCUSSION

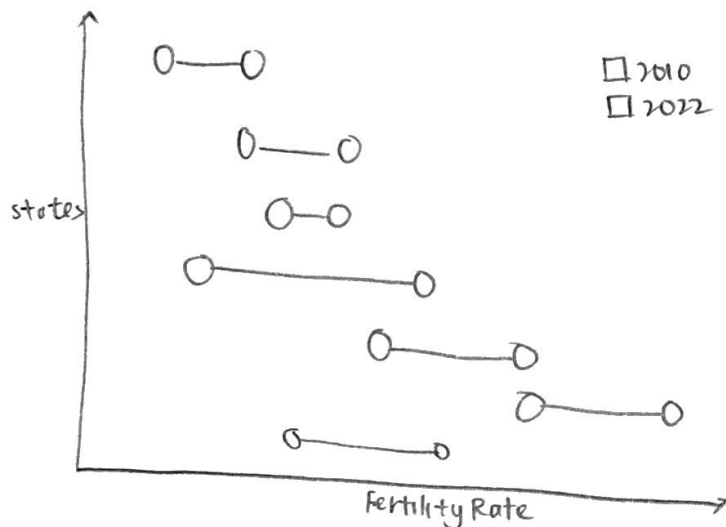

Advantages:

- clear relationship representation show negative correlation between factor and fertility rate
- Interactive filters to explore data from different angles

Disadvantages:

- scale misinterpretation for logarithmic scale
- clustered long lists, if it is larger datasets, this bar chart might become cluttered and difficult to scroll through

LAYOUT

Author: Phoebe Ting Wei Jia

Date: 10/10/2024

Sheet: 4

Task: design graphs to visualise the structure or trend of fertility rate of Malaysia

OPERATION

① select age group

- add annotation to specific age group that has interesting patterns

- find the reasons behind it and annotate it

FOCUS

- choose different colour for different categorical attributes

- make sure the lines are not too overlapping

- filter to see the specific age group trend

- choose two different opposite hue for the two years

- not green and red

- not handy for colour blind

DISCUSSION

Advantages

- clarity in presentation, structured format and present data clearly
- ease of comparison, fertility rate are visually distinct, straight forward to compare

Disadvantages:

- complexity for general audience
- limited context
- limited interactions
- should provide additional context

LAYOUT

Worldwide Fertility Trends And Malaysia's Story

How Does Fertility Vary Across our World in 2023

Sheet: 5

Task: Final Implementation Design

OPERATION

① Interactivity

filter choose specific data groups to visualise

② Year's Rate: Tooltip - hover to any datapoint to see details

③ text - annotations are added sufficiently to mark interesting data or storytelling

FOCUS

- choose appropriate color for different
 - ↳ quantitative: sequential colour scheme
 - ↳ qualitative value: hue colour scheme
- make sure data points are chosen with appropriate colour
 - some color may be too hard to see
 - some size of data points should vary obviously to observe patterns
- choose appropriate interactivity for every graphs.

DETAIL

- data will be preprocessed to ensure it is in a suitable format for visualisation
 - in excel or using pandas
- dashboard created using Vega Lite and use Python pandas for data cleaning and appropriate pivoted before plotting graph using Vega Lite
- Github link and Github Repository are accessible via web browsers ensuring cross platform compatibility
- Estimated Time:
 - ↳ data Preparation: 4-6 hours
 - ↳ Dash Board Design: 10-12 hours
 - ↳ Interactivity Implementation: 4-6 hours
 - ↳ Testing and Refinement: 3 hours
- software: Github, web browser, VS code
